## MESSAGE

Here is my Answer to the Office Action Summary

My product is not like Satsukawa, because I use a true prismatic reflect reflector to Reflect on coming vehicle head lighting back to the human eye to that on coming vehicle driver. Also any light that would reflect back from the inside of the front lens it would be redirected back out.

Also any light being generated from the side of the leds would travel into the water clear baffle reflector and fully illuminate the full baffle with the color and light from the LED or light bulb. Also any light from the LED coming out the sides would be redirected out using the baffle cone type reflectors that surround each LED and redirect the light forward out to be visible straight forward and from many angles.
